

CLEANING ASSUMPTIONS

1. The raw data was imported into power bi.
2. Each column of the raw data was formatted according to their data types; alphabet were formatted as texts, price column was formatted as currency, time columns were formatted as time and dates were formatted as dates .
3. For the missing values in the “reason for delay”, column, Search and replace feature was used to replace the empty cells with “No Delay” because the “Journey Status” column for the empty cells were “On Time”.
4. The transaction id column was highlighted to identify and remove duplicates using the “remove duplicates” function in the reduce rows ribbon Data tab and 1 duplicate was found and removed.
5. After data cleaning, I was left with 31,653 rows and 18 columns.
6. Actual arrival time was empty for all cancelled trips, so the empty cells were replaced with “Null” since there cannot be an actual arrival time for a trip that did not happened.
7. To get the time of day for travels, conditional column was used in power query with < 12pm being morning, < 5pm being afternoon and else evening
8. The reason for delay column had inconsistent values (Staffing and Staff Shortage) so the Staffing was standardized into Staff Shortage to ensure consistency since they mean the same thing.
9. In addition, the Weather and Weather condition values in the reason for delay column were standardized to Weather.
